SURGICAL INSTRUMENTS AND TECHNIQUES FOR TREATING GASTRO-ESOPHAGEAL REFLUX DISEASE Related Applications

This application is a divisional of copending U.S. Application Serial No. 09/222.501, filed December 29, 1998, which claims the benefit of provisional U.S. Application Serial No. 60/086,068, filed May 20, 1998, and entitled "Surgical Instruments and Techniques for Treating Gastro-Esophageal Reflux Disease."

This invention relates to instruments and techniques for thermally-mediated therapies of targeted tissue volumes in a patient's LES (lower esophageal sphincter) to treat gastro-esophageal reflux disease (GERD) in a minimally invasive manner. The thermallymediated treatment, in а low temperature range, selectively injures cells and proteins within the (LES) to induce a predictable wound healing response to populate the targeted tissue with collagen matrices as a means of altering the bio-mechanical characteristics of the LES. In a slightly higher temperature range, an alternative thermally-mediated treatment is used to shrink native collagen fibers within the LES to "model" the dimensions and laxity of the LES. The novel treatment techniques are preferably performed with a trans-
